Related Categories: ColdFusion, Uni-Form Tag Library, jQuery

The other day I announced [the v2 release](#) of the Uni-Form Custom Tag Library, which contains a number of enhancements and [jQuery](#) plugin integrations. One thing *very* important detail that I forgot to mention:

If you are using the Validation plugin, you ***must*** use jQuery 1.2.2 or higher.

As long as you are using the current release you are fine, since it is at 1.2.6 as of this posting. If you use anything 1.2.1 or earlier, you will have all sorts of JavaScript errors being thrown.

Update

This post only applies to those of you who are loading jQuery on your own. If you are relying on the tags to load jQuery for you, jQuery-1.2.6 is the release that is loaded. :-)
