One of the questions that I have been asked repeatedly is

"Why does the cancel button still submit the form?"

Well, as of today, you have the option of changing that behavior.

## New Feature: The `cancelAction` Attribute

You can now pass a URL to cfUniForm via the brand new 'cancelAction' attribute. You may pass a full URL, like so...

```
.. <uform:form action= "#cgi.script_name#"
}. id= "myDemoForm"
}. cancelAction= "http: //www.domain.com/index.cfm" >
```

... or you may pass just a file name, like so...

```
.. <uform:form action= "#cgi.script_name#"
}. id= "myDemoForm"
}. cancelAction= "index.cfm" >
```

If a value is passed, cfUniForm will add it to the rendered JavaScript so that a click of the cancel button will redirect client-side, skipping the default action. It should be noted that this is handled by setting the [window.location.href](#) , so if you provide an invalid value, you'll probably end up with some rather strange behavior.

## Bug Fix: Cancel Button + Validation

When validation rules were added via the `validationSetup` attribute, clicking the cancel button would still cause validation routines to run. This bug has been fixed, and the cancel button now bypasses validation.

As always, be sure to [download the latest](#) and visit the [cfUniForm demos](#) .
